APPENDIX D

Flush Volume When Adjusted to Waterline

Contributors

Initiated in 2003 by municipalities and other interested organizations in Canada, the Maximum Performance (MaP) Testing program was a cooperative effort among Canadian and American partners, including:

Canada

- Canadian Water and Wastewater Association (CWWA) – **LEAD AGENCY**
- B.C. Capital Regional District, Victoria, British Columbia
- B.C. Buildings Corporation, Victoria, British Columbia
- Canada Mortgage and Housing Corporation
- Calgary, Alberta
- Edmonton, Alberta
- Greater Vancouver Regional District, British Columbia
- Halifax, Nova Scotia
- Hamilton, Ontario
- Montreal, Quebec
- Ottawa, Ontario
- Region of Durham, Ontario
- Region of Halton, Ontario
- Region of Peel, Ontario
- Region of Waterloo, Ontario
- Toronto, Ontario
- Winnipeg, Manitoba

U.S.A.

- California Urban Water Conservation Council, Sacramento, California
- East Bay Municipal Utility District, Oakland, California
- Los Angeles Department of Water and Power, Los Angeles, California
- Seattle Public Utilities, Seattle, Washington
- Tampa Bay Water, Clearwater, Florida

We gratefully acknowledge the contributions from these participating agencies and municipalities.

Disclaimers

The information in this report is believed to be an accurate description of the units tested and the results obtained. Every effort was made to ensure the accuracy of the findings including, but not limited to, preparation of a detailed test protocol and third-party oversight of testing protocol implementation. However, because only a single unit of each model was tested, these results should not necessarily be considered as fully representative of the typical or average production of the models tested. The results shown in this report should be viewed only as an indication of expected ‘field’ results for waste removal.

Although the test protocol utilizes a media whose physical properties resemble typical human waste, the reader is reminded that there is an enormous variation in human waste from person to person, and from one day to another.

Neither the authors, reviewers, project supporters, sponsoring partners, CWWA, nor their employees make any warranty, guarantee, or representation, expressed or implied, with respect to the accuracy, truth, effectiveness, or usefulness of any information, method, or material in this document, or assume any liability of the use of any information, methods, or material disclosed herein, or for any damages arising from such use. Readers use this report at their own risk.

Neither the authors, reviewers, project supporters, sponsoring partners, CWWA, nor their employees endorse products or manufacturers. Trade or manufacturers’ names appear herein not as an endorsement but solely because they are considered important to the object of the project.

Readers are invited to distribute this report in whole or in part but any changes made to the document must first be approved by the CWWA or one of its agents.

Readers are reminded that this report represents a ‘snap shot’ of the performance levels achieved by certain toilet fixtures at a particular time and with particular trim inside. Manufacturers sometimes make permanent or temporary changes to trim components or to model designs without changing the model names or model numbers. As such, changes to the models tested in this report may have occurred since the testing was completed.

Toilets tested as part of this program are in no way intended to represent all makes and models available in the marketplace. This report is not intended to provide a comprehensive evaluation of all toilet models available in the marketplace.

The results obtained during this testing program are not a guarantee of performance.

The reader is reminded that there are criteria *in addition* to solids removal that should be considered when selecting a toilet model, e.g., bowl wash, availability of replacement parts, potential for leakage, noise, etc. MaP testing addresses only a single issue: the ability of a toilet model to completely remove solids in a single flush.

Both consumers and manufacturers are encouraged to provide feedback to the authors of this report, especially regarding issues such as incorrect model numbers, models that are listed but are no longer available, etc.

Revised MaP Testing Protocol

This 6th Edition of the MaP testing results is the first report on tests that use the new MaP testing protocol (revised September 2005).

Readers are encouraged to read and become familiar with all aspects of the new testing protocol, but the primary changes incorporated into the revised protocol are as follows:

- Testing for water change-out has been eliminated
- Individual 50g test media specimens (soybean paste) are now encased in a thin latex membrane (similar to a sausage) and can be reused several times.
- Toilet models must successfully clear all test media in a minimum of four of five attempts (vs. two of three attempts used in earlier test protocol).
- Testing is attempted at following mass loadings: 250g, 300g, 350g, 400g, 500g, 600g, 800g, and 1000g. No testing is completed with mass loadings exceeding 1000g.

We believe that the new protocol and test media will make it easier and less expensive for manufacturers, laboratories and other organizations to complete MaP testing.

The revised MaP testing protocol, in its entirety, is provided in **Appendix A**.

1.0 BACKGROUND

Although virtually all toilet models sold in Canada and the U.S. meet both the flush volume and performance requirements of the Canadian Standards Association (CSA) and the American National Standards Institute/American Society of Mechanical Engineers (ANSI/ASME), there remains some question as to whether models that meet the minimum certification requirements also meet the expectations of the consumer. What's more, since certification testing offers only a pass/fail grading, there is currently no easy way to distinguish between superior and marginal toilet models available in the market.

Most residential and light commercial toilet models exceed customer performance expectations while flushing with no more than 6 litres (1.6 gallons). However, recent research in Canada and the U.S. concludes that there are also certified and commercially available models that do not meet customer expectations.

There are two key concerns:

- 1) Fixtures that fail to meet the maximum 6-litre flush requirements of the CSA or the 1.6-gallon requirements of the ANSI/ASME¹ result in toilets that flush with too much water;
- 2) Fixtures that do not flush effectively usually result in customer complaints, customers having to ‘hold the handle’ for an extended time (thereby using more water), or the need for double flushing (also using more water).

Currently, however, there is no convenient way for the customer to readily distinguish between good and marginal performers. In addition, this lack of information on toilet performance levels has served to create a negative perception regarding 6-litre (1.6-gallon) technology in general, as opposed to identifying only those “bad apples”.

Although other toilet performance studies have been completed, none of these has been performed using test media as realistic as that used in this program, nor has a quantifiable performance benchmark – based on the results of relevant medical data – been established.

We developed the Maximum Performance (MaP) testing to identify how well popular toilets models perform using a realistic test media, and to grade each toilet model based on this performance. A soybean paste having similar physical properties (density, moisture content) to human waste was used in combination with toilet paper as the test media. In addition to using a realistic test media, all toilet samples are adjusted, where possible, to their rated flush volume (typically 6 litres / 1.6 gallons) prior to testing to ensure a level playing field.

The original testing protocol required the soybean paste to be extruded through a 7/8-inch (22-mm) die and cut into 50-gram specimens (each specimen approximately 100 mm or 4 inches in length). Toilet models were subjected to progressively larger loadings (in 50-gram increments) until the fixture failed to completely clear the bowl in two of three attempts (now four of five attempts), or to fully restore a minimum 50mm (2-in.) trap seal. Since then, the soybean paste media has been encased as described on the previous page.

¹ Certification testing is intended to ensure that each model meets a specific set of minimum requirements for health and safety, product integrity, and performance. There is no differentiation in certification between a toilet model that just meets the minimum requirements and one that surpasses those requirements.

This **6th Edition** of the MaP testing report supersedes all earlier editions. Over 35 additional toilet fixture models are included in this edition, bringing the total to 213 different models measured for their flush performance. In addition, some previously tested models have been re-tested. Beginning with the **4th Edition** only a single sample of each toilet model was required to be submitted for testing (previous requirement was two samples). This change was made because of the relative consistency in model performance noted in earlier MaP testing and to better align MaP testing requirements with those of other testing agencies.

The original MaP report (2003) contained information on replacement flapper interchangeability. Information on checking and replacing toilet flappers can now be found on the web at:
www.toiletflapper.org.

Whereas MaP testing is strictly performance-related, it is also considered important that those toilet models subsidized by water utilities (e.g., through rebate programs) sustain their water savings over the life of the fixture. The L.A. Supplemental Purchase Specification (SPS) was developed for this purpose and can be found at:

<http://www.cuwcc.org/Uploads/product/LADWP-SPS-ULFTReqs.pdf>

The minimum performance benchmark adopted by MaP is 250 grams of waste. That is, a toilet fixture should completely evacuate at least 250 grams of waste in a single flush action. This value is based on the results of a British medical study (*Variability of Colonic Function in Healthy Subjects*) that identified 250g as the average maximum fecal size of the male participants in the study. Thus, any toilet that meets or exceeds the 250g performance threshold should meet customer expectations for flushing (see section 2.2).

Overall, the MaP testing protocol appears to be well-received by both water providers and manufacturers alike. We expect that many agencies and municipalities will consider the results of MaP testing when evaluating which toilet models to subsidize or rebate.

2.0 MAXIMUM PERFORMANCE (MAP) TEST

2.1 Critical Aspects of Test

MaP testing includes three significant advancements from earlier studies completed by others and from the national standards promulgated by CSA and ASME:

- Non-realistic test media (sponges, plastic balls and beads, kraft paper, etc.) replaced with combination of encased soybean paste and wads of toilet paper. Most agree this media more accurately replicates “real-world” demands upon a toilet fixture.
- All models are adjusted to rated volume, generally 6 litres (1.6 gallons) prior to testing.
- As noted above, a minimum level of acceptable performance was identified.

2.2 Minimum Level of Acceptable Performance - Medical Data

A British medical report² outlines the results of fecal tests completed on 10 male and 10 female subjects eating normal diets. The study identified the *average maximum*³ fecal size of the male participants to be approximately 250 grams and the 95th percentile size to be 305 grams⁴. The *average maximum* for women was slightly less at 237 grams, with the 95th percentile at 275 grams. The *average* fecal size of all participants was 130 grams⁵.

Based on this medical study, it appears that for sanitary reasons, as well as for customer satisfaction, toilets should be able to flush a *minimum* of 250 grams of solid waste. Therefore, for the purposes of this study, 250 grams (250g) was set as a performance benchmark.

The photos below illustrate some of the aspects involved in MaP testing.

Test rig (top left), bulk & extruded media (top right), packaged media (bottom left), dropping media (bottom right).

² J.B. Wyman, K.W. Heaton, A.P. Manning, and A.C.B. Wicks of the University Department of Medicine, Bristol Royal Infirmary, *Variability of colonic function in healthy subjects*, 1978.

³ The average of the largest individual “samples” collected from each participant during the program.

⁴ It would be expected that only 5% of male samples would be larger than 305g.

⁵ A toilet only capable of flushing the *average* loading (130g) would be expected to plug/clog or fail about 50% of the time, therefore, the benchmark of 250g (average male maximum) was selected for this project.

2.3 Soybean Paste Test Media

Soybean paste was selected as a test media because its physical characteristics (density, moisture content) are reasonably similar to those of human waste. The test media has the following properties: moisture content 51.5 percent, pH 4.78, and density 1.16 grams/mL. Previously, the media was extruded through a 7/8-inch (22mm) diameter die, each specimen being approximately four inches (100mm) long and weighing 50 grams (± 5 grams). The new test protocol encases the specimen in a thin latex membrane, enabling re-use of the specimen for multiple test runs.

2.4 Media Source

Although several media with varying physical characteristics were evaluated during initial project development, the specific media used in the MaP testing is obtained in 20-kg (44-lb) containers from a single Canadian importer (the product originates in Japan). Readers wishing further information regarding the paste should contact Veritec directly.

2.5 Test Protocol

The MaP test protocol (Version 2 - 2005) is included in **Appendix A**. All toilet fixtures are assembled, placed on the test stand, and connected to a municipal water supply adjusted to 50 psi static pressure. Tank water levels are set to the waterline and flush volumes recorded. Adjustments are made, if necessary, to ensure all samples flush at their rated volume, generally 6 litres (1.6 gallons).

The ability of a toilet to completely remove 100 percent of waste in a single flush without plugging or clogging is considered by many to be one of the most important test criteria. Testing is conducted by loading the fixture in 50-gram increments of test media until it fails to pass 100 percent of the media in at least four of five attempts. Four loosely crumpled balls of toilet paper (six sheets each) are included in each test run. The toilet paper used in testing has the following specifications: single ply toilet paper conforming to ASME A112.19.14-2001, section 3.2.5.1.2. Minimum level of acceptable performance is set at 250g. Test results sorted by manufacturer are presented in **Appendix B** and sorted by performance level are presented in **Appendix C**.

Note: although individual MaP testing reports identify the maximum flush volume when tested as per the Los Angeles Department of Water and Power Supplementary Purchase Specification (LADWP SPS), this should not be confused with Certification to the SPS. Manufacturers are required to submit their product to an IAPMO-approved laboratory for Certification to the SPS. **Appendix B** and **Appendix C** identify those MaP-tested products that have also been certified to the SPS by one of those laboratories.

3.0 CONCLUSIONS

There is a significant range in the maximum performance levels of fixtures tested in this program – some fixtures failed to meet the 250g threshold – yet all of these models are certified as meeting the minimum standards set forth by CSA and ANSI/ASME.

Appendix B and **Appendix C** colour-code (color-code) models clearing less than 250g of media, models clearing from 250 and 500g, and models clearing greater than 500g. Pressure-assisted models, both 6- and 4-L (1.6- and 1.1-G), and HET⁶ models are also coded for ease of identification.

⁶ High-Efficiency Toilet

4.0 RECOMMENDATIONS

Based upon the research conducted and the test results obtained through this Sixth Edition, the authors recommend that:

1. All toilet models be required to remove at least 250g of solids as part of qualification or certification for code-compliance.
2. Municipalities and other rebating agencies should consider giving priority to toilet models that meet the LADWP SPS as these toilets are more likely to sustain water savings over their physical lifetime. Proprietary flappers (unique to the particular toilet model) are preferred to early-closing models as they are more likely to be replaced with the correct flapper. Proprietary flappers are, however, generally more difficult to locate and purchase.

APPENDIX A

**Maximum Performance (MaP) Toilet
Fixture Performance Testing Protocol,
Version 2 - September 2005**

Appendix A

Maximum Performance (MaP) Testing

Toilet Fixture Performance Testing Protocol

Version 2 - September 2005

1.0 Scope of MaP Testing

- 1.1 Toilet model maximum performance (MaP) level is identified as the maximum media loading (in discreet increments expressed in grams) at which toilet model successfully clears all media from fixture in at least four of five attempts.
- 1.2 Tests where toilet sample clogs, plugs, or fails to restore a minimum of a 2-in. (50mm) trap seal following each flushing test will be deemed a failed test.
- 1.3 MaP test media is comprised of the following:
 - 1.3.1 One or more 50 ± 4 g test specimen (“test specimen”) consisting of soybean paste contained in latex casing, tied at each end forming a ‘sausage’ approximately 100 ± 13 mm in length and 25 ± 6 mm in diameter¹, and
 - 1.3.2 Four loosely crumpled balls of toilet paper (“paper”).

2.0 Testing Protocol

2.1 Fixture Model Selection

- 2.1.1 A single randomly selected sample of each toilet model (“sample”) is required for testing.
- 2.1.2 Toilet models that are not *certified* as provided shall be identified as a “Prototype Model”.

2.2 Set-Up

- 2.2.1 Samples shall be assembled according to manufacturer’s written instructions as contained within the product packaging, and placed on test rig, ensuring tank and bowl are level.
- 2.2.2 Tank water level shall be adjusted to the level specified by manufacturer in the manufacturer’s instructions (e.g., set to waterline).
- 2.2.3 Static water supply pressure shall be set to 50 ± 3 PSIG.
- 2.2.4 Inlet water temperature shall be $15 \pm 10^\circ\text{C}$ ($59 \pm 18^\circ\text{F}$).
- 2.2.5 Flush sample a minimum of three times prior to commencement of testing.
- 2.2.6 Re-adjust tank water level to proper level if required.

2.3 Flush Volume Measurement

- 2.3.1 Measure and record flush volume of sample in accordance with ASME A112.19.2-2003, paragraphs 8.4.1 and 8.4.2.
- 2.3.2 Samples with measured flush volumes in excess of 0.5 litres (0.13 gallons) greater than their rated flush volume shall be deemed to fail MaP testing requirements due to excessive flush volume.
- 2.3.3 Samples with measured flush volumes less than 0.5 litres (0.13 gallons) greater than their rated flush volume shall be adjusted, if possible, to their rated flush volume prior to performance testing.

¹ approximately 4 ± 0.5 inches in length and 1 ± 0.25 inches in diameter

- 2.3.4 Samples with measured flush volumes less than their rated flush volume shall be tested at their measured volume and this volume shall be recorded on test report.

2.4 Waste Extraction Test

- 2.4.1 Test specimens shall be formed by hand such that they are roughly cylindrical in shape and uniform in diameter
- 2.4.2 A test specimen drop guide shall be placed across the top of the bowl, with a 50mm (2-in.) diameter opening aligned over centre of bowl sump. Drop guide may be made of plastic or other rigid material, to be no more than 12mm (0.5-in.) thick, and be of sufficient length to span top of toilet bowl.
- 2.4.3 Test specimens shall be freely dropped in a vertical orientation through opening in drop guide into bowl. Additional test specimens shall be added, as required, to achieve desired mass loading. Record total mass loading.
- 2.4.4 Remove drop guide and freely and randomly drop four balls of crumpled toilet paper over centre of bowl sump.
- 2.4.5 Wait 10 ± 1 seconds.
- 2.4.6 Flush sample. Collect discharged media in strainer or other suitable container positioned below toilet fixture.
- 2.4.7 Record test as **Pass** or **Fail** (test is a **Fail** if any waste remains in the bowl or trap, or if minimum 50mm (2-in.) trap seal has not been restored).
- 2.4.8 Remove (rinse) discharged toilet paper from test specimens, and prepare test specimens for further testing.
- 2.4.9 Flush sample to clean bowl and trapway and fully restore trap seal.
- 2.4.10 Increase (or decrease) mass loading, as required, based on the following intervals, and repeat waste extraction test until such time as the maximum loading has been reached as described in paragraph 2.4.11:

- 250g
- 300g
- 350g
- 400g
- 500g
- 600g
- 800g
- 1,000g

No testing shall be conducted at mass loading greater than 1,000g.

- 2.4.11 Record highest mass loading at which toilet test sample successfully removed all test media from fixture and restored minimum 2-in. trap seal in at least four of five attempts. This loading represents the maximum performance level for the test sample (i.e., the MaP score).

3.0 Test Media Specifications

3.1 Soybean paste nominal specifications:

- 35.5% water, 33.8% soybean, 18.5% rice, and 12.2% salt, and having a density of 1.15 ± 0.10 g/mL (i.e., density greater than that of water).

3.2 Latex casing specifications:

- Casings made from non-lubricated latex condoms (LifeStyles® brand, purchased from Ansell Healthcare Products LLC, Dothan, AL 36303 USA).

3.3 Cord used to tie casing:

- 1.0mm diameter polymer cord that will not crack or harden with time (Stretch Magic Bead & Jewelry Cord, Pepperell Braiding Company, P.O. Box 1487, Pepperell, MA 01463, 800-343-8114)

3.4 Cased test specimens:

- Each test specimen shall have a mass of 50 ± 4 g.
- Test specimens must be able to span clear distance of 76mm (3-in.) for minimum of 15 seconds when tested at room temperature (setup illustrated in Figure 1).
- Test specimens with rips, tears, punctures, or other damage, shall not be used.
- Test specimens may contain small volumes of air, however, specimens that float shall not be used.

3.5 Recommendations for storage of cased test specimens:

- Test specimens should be stored in air-tight containers and refrigerated when not in use. A damp sponge should be placed in bottom of container to prevent test specimen drying.

3.6 Toilet paper specifications:

- Each ball of paper is comprised of six sheets of single ply toilet paper conforming to ASME A112.19.14–2001, section 3.2.5.1.2

NOTE Cased test specimens (ready-to-use) may be purchased from:
